## Summary

Final-year CSE(AI) undergraduate at Amrita Vishwa Vidyapeetham with strong foundations in data structures and algorithms (241+ LeetCode problems solved) and hands-on experience building scalable production systems across AI and backend domains. Hackathon Runner-Up (Superhack 2025, 200+ teams).

## Education

### Amrita Vishwa Vidyapeetham

B.Tech in Computer Science & Engineering (AI)

CGPA: 8.26/10.0

### Sri Chaitanya Techno School

Class XII: 91% — Class X: 98.2%

Coimbatore, India

2023 – Present

## Experience

### TechZeeb

Software Developer Intern

Remote

Jun 2025 – Aug 2025

- Built and shipped the ‘**Kovai Natural Farmers**’ platform end-to-end, from database schema design to production deployment.
- Cut API response latency by 40%** by refactoring server-side JavaScript and rewriting slow **MySQL queries** with indexed lookups and query optimization.
- Grew mobile engagement by 30%** by rebuilding the UI as a fully responsive, cross-platform experience.

## Technical Skills

Languages: Python, C++, JavaScript

AI/ML: PyTorch, TensorFlow, HuggingFace Transformers, RAG, LLM fine-tuning, NLP, Computer Vision, Pandas, NumPy

Backend & Web: FastAPI, Flask, Express.js, Next.js, React

Databases: PostgreSQL, MySQL, MongoDB, Pinecone (vector), Supabase

Infrastructure: Apache Kafka, Docker, AWS (Bedrock, Textract), Azure, CI/CD, Git

## Projects

### Anomyst — Data Pipeline Health Monitoring [\[GitHub\]](#)

Python, FastAPI, Next.js, PostgreSQL, Groq Llama 3.3, SciPy

- Designed and built a full-stack anomaly detection platform that learns **statistical baselines** from historical pipeline runs and flags deviations using **Z-score drift** and **KS-tests**, achieving **~90% detection rate** and **~3% false-positive rate** across 100 synthetic injection runs.
- Implemented a **cold-start fallback** (rule-based null/schema/volume checks) graduating to **pooled-stddev baselines** after  $\geq 3$  runs, with all thresholds centrally configurable to avoid magic numbers.
- Integrated **Groq Llama 3.3** to convert raw statistical anomalies into human-readable root-cause narratives; processed **100k-row datasets in ~120ms** average end-to-end.

### Thala — Intelligent Incident Management System [\[GitHub\]](#)

AWS Bedrock (Llama 3.3), Kafka, Elasticsearch, Flask, AWS Textract

- Runner Up, Superhack 2025** (200+ teams) — Built an autonomous incident agent processing **Slack/Jira** tickets via async **Kafka** pipelines with real-time severity classification using **Llama 3.3**.
- Integrated **Elasticsearch** for semantic resolution retrieval and **AWS Textract** for OCR on image attachments, enabling the agent to auto-resolve tickets using historical context.
- Designed an end-to-end asynchronous pipeline capable of handling concurrent incident streams without blocking, reducing mean time to resolution.

### VigilanceStream — AI Security Monitoring Engine [\[GitHub\]](#)

Python, Groq AI (Llama 3 70B), Apache Kafka, Supabase, Next.js, FastAPI

- Architected an **event-driven microservices engine** streaming raw system logs through **Kafka** for micro-batch threat analysis in **5-second windows**, enabling sub-second detection latency.
- Leveraged **Llama 3 70B (Groq)** for semantic intent analysis to detect complex multi-step attacks (e.g., account takeovers, credential stuffing) beyond rule-based detection.
- Automated IP blocking at an **80% confidence threshold**, reducing manual security intervention with a fully autonomous response pipeline.

## Achievements & Hackathons

- Runner Up**, Superhack 2025 — Thala: Intelligent Incident Management System (200+ competing teams).
- Top 20%**, Build With India 2025.
- Semifinalist**, Providence Leap Ideathon 2024 — NEXGEN: Wearable Health Tech.
